</tbody>
</table>

All the entries have been sorted according to the statewide yield rank results

*Please note that FHB Index based on visual symptoms of the disease is coming from a high disease pressure misted nursery set up at Beltsville. Although, DON content results are the true indicators of genetic resistance, this year due to the COVID-19 situation, DON content analyses results are still awaited and will take longer to obtain. DON results will be provided as soon as available.

$\text{§}$Leaf rust was observed at adult plant stage at the Wye research station, UMD. The scores are based on natural inoculations, and are on a scale of 1-9, where 1= Highly Resistant and 9= Highly Susceptible

$\text{¶}$Glume Blotch was observed at multiple locations across the state. The scores are based on natural inoculations, and are on a scale of 1-9, where 1= Highly Resistant and 9= Highly Susceptible

* $\text{§} \text{¶}$Cells highlighted in green indicate resistance according to the parameters listed above.
