Agronomy Facts No. 32  
Revised January 2014

## 2013 MARYLAND SOYBEAN VARIETY TESTS

Maryland soybean variety tests are conducted each year by the Maryland Agricultural Experiment Station, Department of Plant Science and Landscape Architecture, to provide soybean growers with the latest information on agronomic performance of soybean varieties. Varieties are tested by maturity group as designated by the releasing organization. Varieties of Maturity Groups 3, 4, and 5 are included in the tests because they are best adapted for production in Maryland. Late maturing varieties in Maturity Group 4 (relative maturities of 4.6 to 4.9) were evaluated separately from the other varieties in Maturity Group 4 and are listed as "4s" in the data tables. All entries in the 2013 test are tolerant to Roundup herbicide. Entries with STS in their names also have tolerance to the sulfonylurea herbicides. The brands and suppliers of the entries in this year's test are listed in Table 1.

The Maryland tests are designed to evaluate varieties at several planting dates and on various soil types within the soybean production areas of the state. Recommended cultural practices were followed in the establishment of each test. Tillage, row spacing, seeding rates, and plot length varied between tests and locations as shown in Table 2. Seed yield was determined on center rows of each plot, and plots were trimmed to a uniform length just prior to harvest. Each plot was replicated three times in each test and location. Seed moisture was determined on each plot and seed yield was adjusted to a 13% moisture level. Plant height and lodging were determined at maturity when 95% of the pods on each variety had attained their mature color.

The 2013 growing season was generally one of favorable temperatures and soil moisture in most areas of the state. Rainfall during June and July was above average at Quantico and Queenstown. The wet soil conditions resulted in the appearance of *Phytophthora* disease symptoms on several entries in both the full-season and double-crop tests at Quantico. Timely rainfall across the state in September and October resulted in good yields for both full-season and double-crop plantings. Scattered frost across the state in late October impacted the maturity date for the Maturity Group 5 varieties in the double-crop tests at Quantico and Queenstown. Monthly rainfall amounts for May through October for the test locations are shown in Table 3.

Results of the 2013 tests are reported in Tables 4-9. In each of these tables, varieties within maturity groups are listed in order of yield, highest to lowest. The highest overall test location mean yields were at Keedysville for the full-season tests (63.6 Bu/A) and Quantico for the double-crop tests (61.9 Bu/A).

A least significant difference (LSD) value is reported for each maturity group in every test where statistically significant differences in plant characteristics were observed among varieties. This number is a statistical test calculated at the 20 percent probability level to aid in comparing the differences among varieties in a maturity group. When two varieties are compared for a plant characteristic and the difference between them is greater than the calculated LSD value, the varieties are judged to be significantly different for that specific characteristic. The "ns" designation indicates that there are no statistically significant differences among the varieties in that maturity group for that specific characteristic. The coefficient of variation (CV) is a relative measure of the variation and is an indicator of the degree of precision for a particular test. For these soybean variety tests, CV values below 15% are an indication that the precision of the test is good in distinguishing differences in seed yield between varieties.

The performance of a variety for several years or at several locations in the same year gives a better indication of its yield potential and agronomic characteristics than do data from a single year or location. As an aid in assessing the performance of individual varieties in the test, a relative yield value was calculated. Table 10 summarizes the relative yields of the varieties by expressing their yields as a percentage of the mean yield of all varieties in that maturity group at each location. Therefore, a variety with a relative yield that is consistently greater than 100 is a variety that consistently yields higher than the mean yield of all varieties in that maturity group. In Table 10, the relative yields of those varieties with an asterisk are not statistically different from the highest yielding variety in that maturity group in those tests where a significant difference between varieties was observed in the statistical analyses.

Two-year average yields of varieties previously entered in the 2012 tests are shown in the data tables. The 2012 location average yield for each maturity group and the 2012 LSD value are included in the data tables to compare variety yield differences in both years. The multiple-year data provide additional information on a variety's yielding ability. The information provided here should be used as a guide and growers should select a variety with great care based on personal experience as well as other available information.

Prepared by: W.J. Kenworthy and N. Hailegiorgies, Department of Plant Science and Landscape Architecture

The financial support of University of Maryland Agricultural Experiment Station and the Maryland Crop Improvement Association are gratefully acknowledged. The contributions of Naod Hailegiorgies, T.S. Ellis, D.K. Armentrout, F.A. Senkbeil, M.A. Sultenfuss, J.I. Streett, and D.M. Justice of the University of Maryland are recognized as being essential in the successful completion of these tests and are gratefully acknowledged.

Additional information:

Inclusion of entries in the Maryland Soybean Variety Tests does not constitute an endorsement or recommendation of a specific entry by the University of Maryland. Advertising statements by an individual company about the performance of its entries can be made as long as they are accurate statements about the data as published, with no reference to other companies' varieties. Statements similar to "See the official University of Maryland Soybean Variety Tests Agronomy Facts No. 32" and "Endorsement or recommendation by the University of Maryland is not implied" must accompany any information that is reproduced. Agronomy Facts No. 32 can be downloaded by selecting 'Soybeans' on the Department's cropping system webpage and choosing the appropriate publication: <http://www.mdcrops.umd.edu/>.

---

WESTERN MARYLAND RESEARCH & EDUCATION CENTER  
Washington County - Keedysville, MD

Tests: Maturity Groups 3, 4, and 4s  
Planting Date: May 29  
Row Spacing: 24 inches  
Soil Type: Hagerstown silt loam  
Soil Test: pH 6.7, P 124 (H), K 149 (G)  
Previous Crop: Grass  
Fertilizer: None  
Lime: None  
Herbicide: 22 Oz/A Roundup Power Max + 5 Oz/A Cloak (May 30)  
Plots: 4 rows, 20 feet long  
Seeding Rate: 6.5 seeds/foot  
Tillage: Conventional

CENTRAL MARYLAND RESEARCH & EDUCATION CENTER- CLARKSVILLE FACILITY  
Howard County - Clarksville, MD

Tests: Maturity Group 3, 4, and 4s  
Planting Date: May 30  
Row Spacing: 24 inches  
Soil Type: Delanco silt loam  
Soil Test: pH 6.6, P 56, K 210  
Previous Crop: Corn  
Fertilizer: 200 Lbs/A 5-14-40  
Lime: None  
Herbicide: 1 Qt/A Roundup Power Max (July 9)  
Plots: 4 rows, 20 feet long  
Seeding Rate: 6.5 seeds/foot  
Tillage: Conventional

Table 2. (Continued) Plot Information

WYE RESEARCH & EDUCATION CENTER  
Queen Annes County - Queenstown, MD

Tests: Full Season, Maturity Groups 3, 4, 4s, and 5  
 Planting Date: May 22  
 Row Spacing: 24 inches  
 Soil Type: Matapeake silt loam  
 Soil Test: pH 5.9, P Index- 127, K Index- 51  
 Previous Crop: Corn  
 Fertilizer: 0-0-120 + 25 S  
 Lime: None  
 Herbicide: Pre: 6.45 Oz/A Authority First +2 Pt/A Medal II (May 21)  
 Post: 1.5 Qt/A Gly Star Plus (July 30)  
 Insecticide: None  
 Plots: 4 rows, 20 feet long  
 Seeding Rate: 6.5 seeds/foot except Maturity Group 5 entries= 6 seeds/foot  
 Tillage: Conventional

Tests: Double Crop, Maturity Groups 3, 4, 4s, and 5  
 Planting Date: July 9  
 Row Spacing: 7.5 inches  
 Soil Type: Matapeake silt loam  
 Soil Test: pH 6.3, P Index- 64, K Index- 120  
 Previous Crop: Wheat  
 Fertilizer: None on soybeans  
 Lime: None  
 Herbicide: Post: 1.5 Qt/A Gly Star Plus (July 25)  
 Insecticide: None  
 Plots: 7 rows, 25 feet long  
 Seeding Rate: 3 seeds/foot  
 Tillage: None

LOWER EASTERN SHORE RESEARCH & EDUCATION CENTER-POPLAR HILL FACILITY  
Wicomico County - Quantico, MD

Tests: Full Season, Maturity Groups 3, 4, 4s, and 5  
 Planting Date: May 22  
 Row Spacing: 20 inches  
 Soil Type: Nassawango silt loam  
 Soil Test: pH 6.2, P sat ratio- 11, K ppm- 137  
 Previous Crop: No Tillage Corn  
 Fertilizer: 250 Lbs/A 05-05-30  
 Lime: None  
 Herbicide: Preemerge: 1.5 Pt/A Roundup + 1 Pt/A Dual II Magnum  
 Post: 1.5 Pt/A Roundup+1 Pt/A Dual II Magnum+ 2 Oz/A 2,4-DB (July 16)  
 Plots: 4 rows, 20 feet long  
 Seeding Rate: 6.5 seeds/foot except Maturity Group 5 entries= 6 seeds/foot  
 Tillage: None

Table 2. (Continued) Plot Information

LOWER EASTERN SHORE RESEARCH & EDUCATION CENTER-POPLAR HILL FACILITY  
Wicomico County - Quantico, MD

Tests: Double Crop, Maturity Groups 3, 4, 4s, and 5  
 Planting Date: June 26  
 Row Spacing: 20 inches  
 Soil Type: Nassawango silt loam  
 Soil Test: pH 5.9, P sat ratio- 16, K ppm- 129  
 Previous Crop: Barley  
 Fertilizer: None on soybeans  
 Lime: None  
 Herbicide: 1.5 Qt/A Roundup + 1 Pt/A Dual II Magnum + 2 Oz/A 2,4DB (August 5)  
 Plots: 4 rows, 20 feet long  
 Seeding Rate: 6 seeds/foot  
 Tillage: None

FS=Full Season, DC=Double Crop

ns=no significant yield differences among entries in this maturity group

\*Yield is not significantly different from the highest yielding entry in this maturity group at this location.

Actual yield can be obtained by converting the relative yield to a decimal percentage and multiplying this value by the location/group mean yield. A variety with a relative yield that is consistently greater than 100 is a variety that consistently yields higher than the mean yield of all of those varieties in that maturity group.
